not been a kilogram of supplement fed since the first cow calved; this has been pure milk production and genetic expression from pasture - New Zealand farmers, and Kiwi cows at their profitable best.

That’s what we expect, surely? As a fourth generation farmer, I know it hasn’t always been like that. I often tell the story that I was brought up with a piece of sunlight soap in my hand, and if we didn’t use it before Christmas, you didn’t get much milk after Christmas. This related to the practice of pre-milking washing and manual stimulation; lactation persistency was an issue, as was milk let-down. Temperament wasn’t flash either.

But it doesn’t matter how you look at it; the modern cow of 2020 is simply unrecognisable compared to the cow milked a generation ago. These cows today can milk!

I’m a big advocate of the modern cow and a staunch opponent of the 90%-feeding, 10%-breeding principle. Of course feeding and nutrition are important considerations within a farm system, but if the 90/10 breakdown is right, how do we explain the 160 kg MS difference between the top-quartile of all herd cows and bottom-quartile of all herd tested cows (i.e. this is corrected for the age of the cow, her breed, and the location within which she is milked)?

The cow of 2020 is indeed a special asset, but within ‘the herd asset’ a big range of ability and contribution still exists. A good deal of this variation exists following the ‘cow growth years’ where some cows were retained that arguably shouldn’t have been. While I understand their retention at the time, they remained bred from because they fuelled the growth model of the capital gain construct.

But today the focus is more on efficiency-of-conversion of those individual cows.

Increasingly we’re celebrating the dizzy heights of the performance of some of these cows, and putting the critical spotlight on those at the other end of the bell shaped curve.

Farming by numbers

Genetic gain doesn’t just happen. In reality, it’s derived from the elements of the ‘breeders equation’.

Personally, I was fortunate to have had the concept first explained to me (in my Massey days) by the late, great Dr Colin Holmes. He had the concept first explained to me (in my Massey days) by the late, great Dr Colin Holmes.

The old adage of ‘mate the best cow to the best bull to get the best chance of the most desirable outcome’ certainly rings true.

But the breeders equation contains the real good oil, and I’ve been true to it for years on the farm within the ‘Hillstar’ & ‘Te Aranga’ herds, and then for the five years I spent within LIC’s breeding scheme.

All elements of the equation have impact, but for me the two we have most control over (and influence on farm) are the two I’ve put a ring around.

Selection intensity/pressure should be a big driver. Herd testing to better understand ‘the wheat from the chaff’, and then focusing on the overall reproductive performance of the herd to earn the right to not involve those poorer cows in the propagation of the next generation is a key component of the rate of genetic gain.

Generation interval is also a real driver, the concept of which is often borne out on the female side with a farmer’s intent to AB his or her yearlings, citing these as the richest reservoir of genetic merit.

The spring of 2020 has again opened our eyes to the power of the modern cow but there is always room for improvement and we are determined to help deliver those gains.

All the very best as we continue to navigate the general uncertainty around us - but take a moment to be proud of the resilience that is dairy as we look set to power on and deliver the fifth consecutive milk price on the north side of $6, despite the global disruption.

Malcolm Ellis
400kg to 520kg MS/cow in 10 years!
Selective breeding & parentage verification credited as key

In the past decade the Lincoln University dairy farm has reduced its dairy cow numbers by more than 100 without compromising production, with average per cow productivity increasing from 400kg MS per cow to 520kg MS per cow.

“That’s good from both a business efficiency point of view and from an environmental point of view,” says Peter Hancox, Lincoln’s farm manager.

In 2010 the farm was milking 670 cows but today there are 560 cows on the milking platform.

Aside from sharper farm management practices, Peter credits a more-targeted approach to both breeding and production worth for the good gains the farm has made.

Previously a big user of Premier Sires, the farm has in recent years adopted more nominated options, with a focus on making faster strides in genetic gain through use of latest, genomically-selected, young bulls.

The benefits of whole herd testing have therefore gone well beyond easy identification of calves to dams during winter calving (potentially eliminating the labour-intensive job of manually matching and recording animals in the paddock).

A CLEAR LONG-TERM VISION

Peter reflects on 2010, when the Lincoln farm faced a number of business challenges it was keen to confront head-on.

The challenges included a parentage mis-match rate of about 30% on both its 2009-born and 2010-born calves.

Initial DNA testing also indicated its ‘top-160 keepers’ was worryingly inaccurate; 11 of the ‘keeper’ stock had taken a spot ahead of other young stock that showed more genetic worth (based on better parentage/ancestry results, together with its genetic make-up).

The farm wanted to address its animal identification issues, Peter says, along with better attention in exposing the true under-performing stock (i.e. incorrectly identified as high-breeding worth animals due to mis-mothering).

TIME FOR A FRESH FOCUS

Thanks to a combination of accurate management of stock, better repro, targeted genetics, and GeneMark’s ongoing DNA parentage identification, the farm has today overcome those fundamental challenges of a decade ago, Peter says.

“What we do know is that we’ve reduced cow numbers from 670 to 630, and then subsequently to 560, and we’re still doing the same production.

“It’s intriguing to think where we might be in five years time – can we get to averaging 550kg MS a cow? ... will that be the new norm for us?”

Peter says if the Lincoln farm can continue working on its repro and mating management while nailing empty rate and six-week in-calf targets, there was still significant room for improvement.

He says it’s “quite conceivable” that in 10 years the farm could be milking 50 fewer cows while averaging 550kg-600kg MS per cow.

“Parentage mis-match rates can be as high as 30 percent in New Zealand herds. The average cow produces at least 100kg more milksolids than it did 10 years ago.
By introducing Sexed Semen into mating plans, farmers are pushing genetic gain even further. For the past few years, LIC’s Liquid Sexed Semen results have consistently been within 5% of the Non-Return Rate (NRR) of conventional semen; at a 90%+ heifer calf ratio, this allows farmers to fine-tune who they get their genetic gain from.

Consider the difference between a poor producing cow and a productive cow; LIC data shows the national average between the top-quartile of cows and bottom-quartile of cows is 160kg of milksolids (considering only mature cows within the herd). Based on an average herd of 435 cows, that equates to about a $60,000 difference in revenue.

And, by mating a herd’s bottom-20% of cows to beef, a potential additional revenue stream is created - but the kicker is that the most valuable part of the herd is increased by approximately $20 BW points, 10 of which will be inherited by the progeny. That’s worth another year’s genetic gain!

But wait, there’s more. If there’s an opportunity to mate yearlings, this is like adding another year’s gain into the mix (N.B. the first year that the practice is introduced).

Put simply, that’s because the yearlings are the highest genetic merit animals within a herd. On average, 20% of the replacements would be generated by mating the yearling cohort, which equates to an additional $10BW points to the progeny.

In a peak cow environment with significantly increased focus on productive efficiency of an individual cow, the rate of genetic gain you choose to make is a critical consideration.

The over-arching guideline that LIC’s bull acquisition team relies on is the cooperative’s Livestock Selection Index (LSI). Although closely aligned to the index (BW), the LSI allows the ability to allocate various weightings to different traits, such as udder conformation, for example.

Alongside factors within the LSI, weightings on conformation and shed traits are allocated, including:

**Dam selection:** Using LIC’s extensive database, animals are narrowed down for possible contract matings. Thousands of three-generation pedigrees are viewed in the ‘hunt’ for the next potential bull dam, all of which fall within set criteria for breeding values (BV), and which will meet conformation thresholds.

**Dam inspections:** Final selection of contract animals takes place in January and February. The bull acquisition team inspect as many of the in-milk cows as possible to ensure conformation looks suitable. Selection staff are qualified TOP (Traits Other than Production) inspectors. The team is mindful of animals that ‘have it all on paper’, but don’t measure up when it comes to visual inspection. Importantly, it’s during these on- farm inspections that feedback from breeders is canvassed (e.g. how the potential dam rates in terms of workability traits, such as temperament and milking speed).

Mating allocations: LIC’s sires of sons are carefully selected. Given the potential influence these bulls have, it’s imperative the ‘best of the best’ are identified. Making the grade as a sire of sons demands a high LSI, and a desirable balance of traits including conformation breeding values.
A ONE-TONNE MILLIONAIRE

by Simon Worlth, LIC livestock selection manager

carton couple Ray and Sandra Hocking recently visited LIC’s Newstead bull barn in celebration of a bull they owned that became only the fourth sire in New Zealand history to reach the outstanding milestone of 1,000,000 straws sold!

San Ray FM Beamer ET S2F follows in the footsteps of LIC Hall of Fame legends SRD Dawsons Belvedere, Kingsmill P A Walesa, and SRB Collins Royal Hugo.

It’s very likely, given the emergence of the genomic era, that Beamer will be the last New Zealand bull to reach the magic million milestone.

As quoted by the renowned Holstein International magazine in September’s issue: “Beamer is a remarkable bull – no wonder he became the world’s 56th Holstein millionaire.”

The story of Beamer is intriguing. His dam, SRB Keredene Skelton, proven at Bust, was contracted for an embryo transfer (ET) programme.

His legacy seems set to live on through the next decade of New Zealand dairy breeding and beyond.

They saw the great potential in this animal, who went on to calve no less than 12 times and classify Excellent (conformation score).

It was the ET flush mating to the incredible (LIC Hall of Fame inductee) Fairmont Mint-Edition that was subsequently purchased by Ray and Sandra Hocking.

The initial motivation for the Hockings was the generation of heifer calves.

But when only bulls were born, and the Andersons extended the kind offer to take the young bulls back, that Ray recalls thinking: “knowing my luck, if I leave them behind one of them will be a hit.”

He decided it would be best to take one of the three full brothers, but which one?

The bull in the middle of course, and Arkans FM Brilliant, Ray says (the logic being that in his early days Ray had enjoyed the middle of the scum).

Interestingly, the three bulls lined up the day Ray went to visit Stewart and Kathryn Anderson turned out to be Arkans FM Brilliant, San Ray Beamer (in the middle, of course), and Arkans FM Buster.

All three bull calves went on to make an impact through Premier Sires (Buster with more than 640,000 inseminations). At one time all three bulls were within the top-10 Holstein Friesian bulls on DairyNZ’s Ranking of Active Sires list.

Now aged 10, and with upward of 75,000 milking daughters in more than 5500 herds across New Zealand, Beamer still ranks within the top echelons of New Zealand’s best dairy breeding bulls.

In fact, at 237 BW, he has been named for a sixth (and record-equalling) season within LIC’s Holstein Friesian Premier Sires team.

And across the industry more than 50 Beamer sons, and many more grandsons, have been progeny tested.

San Ray Beamer (in the middle, of course), and Arkans FM Buster.

Farmers set record!

Using milk samples for further health tests on cows has never been so popular

by Katherine McNamara, LIC Diagnostics business manager

Farmer demand for health data on their cows is hitting record levels this season.

LIC’s Riverlea laboratory in Hamilton expects to process and deliver at least 1 million individual diagnostic tests this milking season (on herd test samples from around New Zealand).

The specialised tests provide farmers with powerful information for better on-farm decisions when it comes to events such as pregnancy and dry-off, and in battling disease that can affect both production and reproduction.

Diagnostic tests on herd test milk include identification of bovine viral diathrorea (BVD) and Johne’s disease, both of which can have a negative impact on production and reproduction outcomes.

Another test, Staph aureus, indicates whether the cow carries nasty bacteria that will negatively affect its milk content.

Other tests can be carried out to find whether the cow’s milk content is A2/A2 (as opposed to possessing an A1 allele), or to find whether the cow is pregnant.

Back in 2013, BVD was the only test of this type, and more than 30% comes from new customers who have signed up for the first time this season.

Of even greater demand is the number of farmers who want to learn more about the possible presence of Johne’s Disease in their herd.

DairyNZ estimates Johne’s Disease annually costs New Zealand farmers $40-88 million in lost production (additional, less obvious, costs include lost opportunities for genetic gain in cattle, and costs associated with breeding, feeding, and raising young stock that may end up being culled).

Johne’s disease has been present within the NZ national dairy herd for at least 100 years, but until recently there’s been limited success in managing the disease on farm.

Testing and identifying subclinical animals from herd test milk samples, in conjunction with a good farm management plan devised alongside a vet, can help manage Johne’s more effectively and efficiently.

This year LIC expects to process in excess of 600,000 milk samples for Johne’s disease, where we’ll identify individual cows that shed high levels of Johne’s bacteria.

Culling those animals is important in control of infection on farm.

For more information on all LIC diagnostic testing contact your LIC Agri Manager.
Earlier this year LIC was able to facilitate several sessions in Northland with National Account customers and vets, but Covid-19 circumstances put a sudden stop to further face-to-face workshops throughout the rest of the country. However, thanks to platforms such as Zoom, the programmes were adapted for online sessions, meaning many farmers could receive a training session in the comfort of their own home.

LIC received more than 850 registrations for the targeted training sessions between April and June. Each of the 22 sessions lasted no more than an hour, and a variety of features were covered, from importing animals into MINDA, to tagging animals, NAIT, and calving preparation.

The sessions were used also as an opportunity to capture feedback that helps in the continued development of MINDA LIVE and MINDA App. Planning is now underway for a 2021 Roadshow that continues the traditional free training LIC has offered over the past few years.

More online training sessions will also be offered, although it’s hoped the training teams will be back out to as many town halls as possible for scenario-based training in MINDA LIVE.

Keep an eye out on LIC’s website and Facebook pages for dates and venues of the 2021 MINDA Roadshows, as well as updates to new features released into MINDA.

The sessions were used also as an opportunity to capture feedback that helps in the continued development of MINDA LIVE and MINDA App.

More online training sessions will also be offered, although it’s hoped the training teams will be back out to as many town halls as possible for scenario-based training in MINDA LIVE.

Keep an eye out on LIC’s website and Facebook pages for dates and venues of the 2021 MINDA Roadshows, as well as updates to new features released into MINDA.

To support the roll out of the new features, LIC has over the past few years offered free MINDA LIVE training in localised areas throughout New Zealand, with hands-on workshops aimed at both beginner and intermediate users of MINDA LIVE, with other sessions focused more on MINDA App.

With continuing growth in MINDA App users, LIC remains committed to further developments: The addition of the Mable Holding Pen (MINDA app), and the launch of the Removed Animals Report (MINDA LIVE).

Other enhancements include:

- tweaks to the print formatting for MINDA LIVE reports (more animals printed per page);
- a change to default groups of a report (allowing farmers to start with their selected group), and;
- changes to the Health Recording areas, making it easier to record what’s happening on farm while keeping the records ‘tidy’.

With continuing growth in MINDA App users, LIC remains committed to further developments: The addition of Notifications is designed in-part to let farmers know when an Animal Evaluation Run is, or, for example, when health treatment doses due.

Additional electronic identification (EID) wand support also features, providing farmers or their staff the ability to connect their iPhone to a Gallagher HR4 or HR5 handheld wands.

More releases are set for introduction in both MINDA LIVE and the MINDA App, helping farmers record and utilise specific information that most-relevant to them; for example, being able to view and record notes and comments about their animals, or being able to create groups in MINDA LIVE based on newly-added attributes.

STORMING UP THE RANKS with the TOP in-mind

117068 - MEANDER SB ARROW-ET S2F: It comes as no surprise this bull remains near the top (334/77 gBW), as he did when he was purchased back in 2016. This outstanding bull bred by Robert and Annmarie Bruin of the deep-south seemingly brings it all. Arrow, currently in LIC's Friesian Premier Sires Forward Pack, steadfastly keeps his place in the team. He comes from two of the most well-known parents in the country: his dam Meander FMI April is a seriously milky cow with very good type, whose lactation worths (LW) have continued to exceed 400, and average 670kg milksolids a year over her past four seasons. On his paternal side, Arrow’s sire is none other than San Ray FM Beamer, who just this year hit the ‘one-million-litre’ mark and is one of LIC’s longest-serving bulls. With data flowing in from 30 TOP daughters, Arrow’s udder overall BV (0.58) has continued to exceed 400, and average 670kg milksolids a year over her past four seasons. On his paternal side, Arrow’s sire is none other than San Ray FM Beamer, who just this year hit the ‘one-million-litre’ mark and is one of LIC’s longest-serving bulls. With data flowing in from 30 TOP daughters, Arrow’s udder overall BV (0.58) has continued to exceed 400, and average 670kg milksolids a year over her past four seasons.

117038 - TANGLEWOOD GL HARDY: Bred by Murray and Nicola Hawkin in the Waikato, Hardy has an impressive 335gBW, and is the number one gBW graduate. Coming from his exceptional fat breeding value (BV) of 13kg, this guy is all about producing daughters that milk. His proven maternal line is a big reason for his impressive production BVs, being the grandson of Tanglewood FME Rain, who has bred several fine contract daughters with production traits. LIC’s biggest producer, Hardy has to offer, and more, with his high production, positive fertility, and farmer traits. With an udder support BV of 0.60 and rear of 0.48, his daughters are sure to see udders that are strongly attached and well supported.

117051 - BUSY BROOK SB FORTUNE: Coming from a well known and proven cow family, Fortunes excellent dam Busy Brook Mill Fay S2F produced a phenomenal 780kgMS last season. Another fantastic San Ray Beamer son, previously used as a Forward Pack genomic bull, he returns to the team with a 273 gBW, and he’s been moving up consistently the past three AE runs. Fortune is a bull that will top efficiency with his positive liveweight-to-production ratio. A massive congratulations to Nathan and Amanda Bayne from Oamaru for producing yet another outstanding bull.

117090 - TRONNOCO MH SAMBA-ET S3F: Here’s an all-rounder with exceptional udder and production traits. LIC’s biggest climber, Samba’s come up a whopping 94gBW and is now sitting nicely at 238gBW, offering 44kg fat and 56kg protein. There’s no doubt that daughters from Samba will produce well.

Out of the very well know 5 family, it’s hard not to be drawn to Sambo’s udder traits. With a fore udder of 0.89 and udder overall of 0.81 he’s an udder strenghtener.

The sire stack behind him is something a bit different, with the Moure Grove Hothouse x Woodcote TF Maximeser both having contributed significantly to the industry.

Breed a Premier Sires bull is nothing new for Tony and Keri O’Connor from Timaru, well done to them for producing such an outstanding bull.

The power these new graduates bring to the Forward Pack team of 2020 is formidable.

DAUGHTER PROVEN

Other young bulls worthy of mention are the following three bulls that have made their way into LIC’s Premier Sires Daughter Proven team: of 49kg alone. Farmers have loved these daughters (overall opinion BV of 0.48), so it’s clear Fortune is shaping up to be a reliable, consistent, all-rounder.

117069 - MEANDER MH ARMOUR-ET S2F: At 231 gBW Armour is looking promising. The sire stack behind this Hothouse x Maelstrom x Dauntless offers something a little different, and boasts an impressive udder overall BV (0.58).

117052 - BUSY BROOK SB FORTIFY S2F: This is looking like a highly productive Beamer son with a fat BV nicely at 238gBW, offering 44kg fat and 56kg protein. There’s no doubt that daughters from Samba will produce well.

Out of the very well know 5 family, it’s hard not to be drawn to Sambo’s udder traits. With a fore udder of 0.89 and udder overall of 0.81 he’s an udder strenghtener.

117052 - BUSY BROOK SB FORTIFY S2F: This is looking like a highly productive Beamer son with a fat BV
It’s been an unusually challenging year, but the disruption to our communities has been offset in the rural sector with a good, mild winter in many regions, and the best calving weather we’ve had in decades.

With a breed headline of Jerseys outperforming all other breeds when it comes to producing kilograms of milksolids per kilogram of liveweight, it’s an exciting time as LIC’s sire selection team analyses the new sire graduate information for the golden breed.

Not only does LIC have the absolute standout Jersey sire Flint in first spot among All Breeds (8 October Ranking of Active Sires list, or RAS list), the cooperative claims seven of the top-10 Jersey bulls on that list.

Here, I’m proud to showcase some of the early and exciting 17-code graduates:

317023 - SHEPHERDS LT FLINT ET S3J: Topping the RAS list for Jersey bulls and for All Breeds, this bull bred by Roger Shepherd of Whangarei is simply among the most phenomenal production bulls ever, and has already been selected for Premier Sires.

To put Flint in perspective, his combined protein and fat breeding value of 87.1kg launches him into the top production bracket for all breeds; his fat BV of 55.8kg and protein of 31.3kg are simply outstanding.

Combined with good size and an udder overall breeding value of 0.67, this boy will surely be in every Jersey breeder’s conversation.

Flint is sired by Terrific, one of the most influential sires in the breed, and is backed by the very good dam Francesca, herself sired by Murmur and from a high production cow family.

Francesca has a combined fat and protein breeding value of 61kg, a PW exceeding 700, and an LW of more than 500.

The first five cows in Flint’s maternal line average eight lactations each, confirming the longevity of the family.

LIC is fortunate to already have exciting and high ranking sons out of Flint, including Popeye and Jazzman, both of which are already Sires-of-Sons.

Francesca has a combined fat and protein breeding value of 61kg, a PW exceeding 700, and an LW of more than 500.

Flint’s granddam was also a high producing cow, with a PW above 500 and LWs greater than 400.

Flint will receive considerable use in this year’s Premier Sires Jersey Forward Pack.

Flint is sired by Terrific, one of the most influential sires in the breed, and is backed by the very good dam Francesca, herself sired by Murmur and from a high production cow family.

Francesca has a combined fat and protein breeding value of 61kg, a PW exceeding 700, and an LW of more than 500.

Flint’s granddam was also a high producing cow, with a PW above 500 and LWs greater than 400.

The first five cows in Flint’s maternal line average eight lactations each, confirming the longevity of the family.

LIC is fortunate to already have exciting and high ranking sons out of Flint, including Popeye and Jazzman, both of which are already Sires-of-Sons.

Flint will receive considerable use in this year’s Premier Sires Jersey Forward Pack.

He is certainly shaping as one of those very special bulls that comes along and simply dominates contemporaries of all breeds at a given point in time.

These are indeed exciting times for the breed.

317006 - WILLIAMS PCG TENOR: Another exciting bull, Tenor comes from the Totara Dairy Ltd herd of Mary Williams in Northland.

Tenor comes from the sire Goldie and the solid T cow family, a family with excellent classification scores and production performance.

Tenor has a whopping longevity breeding value of 586 days. His sire Goldie is having an increasing impact on the national herd, with many sons and great daughters.

Tenor is currently in the Premier Sires Forward Pack team and is a bull to watch in the future.

317034 - HEUVEN SUPER WISEGUY: Wise guy is Waikato-bred by Frank and Ida Van Heuven. He is a son of the top bull Superstition, and it’s no surprise that Wise guy is also breeding daughters with good size and liveweight.

Positive attributes include his high fat and protein, good fertility (4.4%), and likeable management traits. Notable too is the longevity and high production down the maternal line, with 10 and more lactations for three most direct descendants in the pedigree.

Wise guy debuts in this year’s Premier Sires Forward Pack.

371025 - MAXWELL GOLDIE MA T AI S2J: Matai is another Goldie son, bred by B & B Maxwell Trust in Taranaki and out of a high production Terrific dam with PWs and LWs that exceed 400.

Matai is regarded as an all-rounder bull, with high breeding values (fat of 36.2kg and protein of 14.4kg), a capacity BV of 0.76, and a dairy conformation BV of 0.64.

Having lifted his BW by 37 points over the last Animal Evaluation run (8 October), he’s definitely another exciting bull to watch, and he can be found in this year’s Premier Sires Daughter Proven team.
CROSSING NEW FRONTIERS: 
THE KX GRADUATES

**THE KX GRADUATES**

*By Camdon Bland, LIC sire analyst*

- Who’s deserving of a future spot as a member of Premier Sires?
- Who’s proving themselves to be the best of the best?

The following are a handful of examples of LIC’s outstanding new KiwiCross graduates:

517043 - GLEN KORU PROCLAIMER-ET

Proclaimer also brings a tidy array of udder, fertility, and capacity BVs to the table.

He comes to LIC via breeders David and Karen Camp, who are nowadays enjoying a well-deserved retirement from dairy farming.

However, the Camps leave a legacy of passionate breeding and a reputation for ‘getting it right’ when it comes to the breeding of both dairy cows and dairy bulls.

It’s little wonder they’ve bred bulls like Proclaimer, Epic, and Beckon (with Beckon still ranking third on the Ranking of Active Sires list published by New Zealand Animal Evaluation Ltd).

The breeding behind Proclaimer is fantastically eye-catching, being an Inca son and out of two Hall Of Fame KiwCross sires in Showman (dam) and Northsea (grand dam). Both these dams are phenomenal cows, who’ve been pumping out the goods from day one, each with sky high production worths (PWs) in excess of 500.

Proclaimer is certainly a sire worthy of both Premier Sires Forward Pack and Alpha selection.

517026 - HOWSES SPRINGFIELD

Next in line and already making a name for himself, Springfield has a powerhouse breeding worth (BW), boasting good solids and fertility BVs.

Daughters from Springfield seem set to follow in the footsteps of his sire Sovereign, with remarkable udders and capacity to match - just the all-round balance LIC’s sire selection team strives for!

Bred by Barry and Wendy Howse, who farm at Matamata, Springfield’s maternal line features an exceptional row of cows stretching right back to his great granddam.

This cow family is celebrated, and it has further bulls still to graduate.

They pride themselves on good sound udders and dairy conformation, and push themselves to new levels of production in the shed season after season.

517042 - LUCK-AT-LAST INSPIRED-ET

Inspired is a bull that really needs no introduction, and we’re increasingly confident he’ll live up to his name.

Sired by the bull who this year hit a million straws, Son Ray Beamer, and out of a Lynbrook Terrific dam, we expected good udders and dairy conformation coupled with great BW; Inspired delivers just that.

Bred by Graham & Maureen Shaw, who used to farm in the beautiful Cambridge area, these breeders definitely had their ‘luck at last’ and deserve to be justly rewarded for their efforts.

Inspired continues to make an impact in the Forward Pack and is sure to put a smile on the faces of the farmers around the country who go on to milk his well-balanced and productive daughters.

517055 - TARAMONT SPRINGTIDE

Another exciting bull selected for Forward Pack, Springtide offers bucket loads of solids and phenomenal udders (1.13) to carry his impressive production. Bred by Jim and Sue Webster of Waikato, Taranaki.

517001 - ARKANS PATRIARCH-ET

Bred this Kraakmans Jaydie son from their outstanding Arks Pracilla-Mint Edition cow, Patriarch has been selected for the Daughter Proven team, and LIC’s sire selection team thanks Stewart and Kathryn Anderson for their heartfelt efforts. Being A1A2, Patriarch is in the Daughter Proven team, allowing farmers to access to superb genetics including udder traits of 1.05 BV, good fertility, and marvellous fat and protein BVs.

517060 - KEGZY REMARKABLE

Just like horses racing for a top spot so too does Remarkable, being pushed forward in the race by high solids 50kgs fat and 35kgs of protein, with superb udder BVs carrying through.

Hats off to Vaughan and Trudy Keegan from K & Z Family Trust for breeding this exceptional Drysdale Sovereign son, who’s an integral part in holding the Forward Pack in such high esteem this year.

**Breeding Details**
Breeder: D & K Camp
Dam: Glen Koru Flo ET
Sire: GyralandExcelIncaSIF
MGS: Nevron Shoumoren

**Production gBVs**
- Protein: 16 kg
- Milkfat: -38 kg
- Milk: -469 l
- Liveweight: -13 kg
- Fertility: 3.4 %

**Total Longevity**: 579 days
**Somatic Cell Count**: 0.07
**Heifer Calving Difficulty**: 1.0 / 66%
**Cow Calving Difficulty**: 0.2 / 90%
**Body Condition**: 2.7

**INDIVIDUAL PRICE**: $317.65
**SPRING PACK FROM**: $23.36 + GST

*If 10% InvestaMate discount applies

**TOP Traits**: 93 Daughters 34 Herds
- Management: BV -0.5
- Adapts to Milking: 0.11
- Shed Temperature: 0.12
- Milking Speed: -0.09
- Overall Opinion: 0.17
- Stature: -0.23
- Capacity: 0.47
- Rump Angle: 0.26
- Rump Width: -0.06
- Legs: 0.01
- Udder Support: 0.35
- Front Udder: 0.20
- Rear Udder: 0.37
- Front Teat Placement: 0.01
- Rear Teat Placement: 0.26
- Udder Overall: 0.35
- Dairy Conformation: 0.38

**gBW/Rel**: $389/75%

**A2 Protein**: A2A2
**Gestation Length**: 21.1 Days

Mark McKenzie took a big risk when he brought the Speckle Park cattle breed to New Zealand about a decade ago.

“We knew the breed went well in Canada, and we knew it had also gone well in Australia, but they were grain-fed animals which thrived in completely different conditions” Mark says.

“We didn’t know how it would go on pasture, but we had a good feeling about it.”

That feeling was perhaps borne from observations the breed was incredibly hardy.

In Canada, where temperatures can get as low as -40 degC, Speckle Park cattle were proven performers.

And in Australia, where temperatures can get as high as +40 degC, again the cattle were proven performers.

Climate wasn’t going to be a factor, Mark says; “they have very thick hides on them.”

“So bringing it here, to breed and grow on a pure pasture diet, on what is hilly, rolling, country, was a relatively new venture for the stud, but it’s been a hell of a journey,” Mark says.

The DAIRY Factor

Mark and his wife Melissa, together with their son Jack, 20, and Molly, 17 are the fifth-generation McKenzie family to run Maungahina Stud near Masterton.

It’s at Maungahina that sheep and commercial cattle are raised alongside Maungahina Hereford and Speckle Park bulls (for annual private auction).

“In grass-fed beef, we have such a great product here in New Zealand, and we’ve found these cattle marble well on grass,” Mark says of the Speckle Park breed.

“Initially we brought them in to just try, but the business has just skyrocketed and it now represents an important income stream for us.

“The dairy industry has been a massive success factor, with the interest in the breed really taking off.”

When the stud first turned to supplying the dairy industry it sold about 200 straws. Today, more than 30,000 Speckle Park straws are supplied to dairy farmers per year through the exclusive arrangement with LIC during a season.

“In my local area I drive down the road and see Speckle on every farm, or two farms where you’d see that throughout all of New Zealand. Obviously the word has got out.”

WHAT’S THE APPEAL?

Dairy farmers have seen their striking colour, Mark says.

“That’s a big advantage, people love that, but they’re also impressed by their lower birth weight, and they’re very vigorous at birth so their survivability on the hill country is incredible.

They’re high-yielding cattle, so they’ll provide more bang for buck than most other breeds.”

Mark says the grain diet of Australia and Canada might give the meat tenderness, but New Zealand’s pasture diet provides incredible taste.

“With the myostatin gene they carry, the meat is so much softer than any other breed, that’s the feedback we’re getting from butchers. It’s a hell of a meat animal. They’re marbling incredibly well and crossing very well over a dairy animal, and are delicious to eat. I know several butchers who are going specifically after dairy-cross Speckle animals. They’re mad about it, that’s how good they are.”

Mark says New Zealand’s conditions mean his stud has been particularly strict on the Speckle Park cattle’s structure. “That comes down to the skeleton of the animal – they’ve got to be able to walk on hills, perform like any other beef breed, so our culling-out rate has been huge just to get the right-structured animals for our conditions.”

“But it’s exciting times as a stud because there’s a lot more numbers,” Mark says, “and we know a lot more about the cattle, and I believe it’s only going to get better and stronger. We’re investing in embryo technology, and have put in more than 1000 of them over the last decade, and will continue to do so. The partnership with LIC has been mutually beneficial.

“For a while now we’ve concentrated on meat and structure, but focus will soon turn to gestation length, that’s our next stage, and we want more consistency with the breed.”

Maungahina Stud

• Maungahina consists of three properties: Maungahina, 600ha rolling hilly lime stone country 8km east of Masterton; Papariki 50ha, east of Masterton all under k-line irrigation, and; Miki Miki, 220ha, 18km north-west of Masterton.

• 400 registered cows consisting of Hereford and Speckle Park; wintering 1000 stud cattle (all performance recorded); 800 commercial ewes.

• Stud stock are treated as any commercial operator would: “From a commercial breeders viewpoint they need to be good producers, fertile, sound and durable.”

• In this year’s Queen’s Birthday honours, Mark’s father, Bruce McKenzie, was made a Companion of the New Zealand Order of Merit for services to the cattle industry.
TOO BUSY TO HERD TEST IN OCTOBER … ALL OTHER NINE TIMES JUST FINE!

Big on herd testing - Waikato breeder and commercial dairy operator Brad Payne carries out herd testing nine times a season.

Cambridge dairy farmer and breeder Brad Payne would herd test 10 times a year, but he works as an LIC AB Technician during October so reluctantly sacrifices the data he’d get during that month of the year.

And while he accepts that herd testing four times a year is standard practice – Brad admits he’s no ordinary farmer and does things “a bit differently.”

He copes fine with his nine, as opposed to 10, herd tests annually, he says.

“For me, it’s all about data and the insights it provides,” Brad says.

“Herd testing is crucial to any farmer, without a herd test you have nothing to go on.”

“Just look at any business, like banks for example: Now they do budgets and audits on their financial positions all the time. It’s just a way of doing basic checks and balances and making sure nothing is amiss.

“Farmers are no different – to me the herd test is a basic, regular, audit. I need to see the profitability and health status of each cow. Each cow is a profit centre; some profit centres will perform and make me money, but I need to identify and weed-out the ones that don’t.”

Given the state of his herd, it’s hard to argue with Brad’s strategy of constant measuring and monitoring. His herd’s breeding worth and production worth (BW & PW) are ranked in the top-2% and top-1% respectively of the national milking herd (i.e. all herd-testing herds that milk a minimum of 50 tagged cows).

A system four farm, Brad’s 750-strong milking herd is 25% Jersey, 25% Friesian, and 50% KiwCross cows.

Even in a low payout or drought year, Brad’s advice to fellow farmers is to avoid cutting the herd test from the budget; rather, it should be thought of as a non-discretionary investment, he says.

“During a low payout if you’re saying no to even a single herd test, well that’s a year’s worth of figures you’ve lost. I know that all people don’t sell or do the breeding thing, but if I was that sort of farmer who was without a single test, I’d have no idea of what’s going on.”

While parentage information is useful, it’s not enough, Brad says.

“Her parentage might be good, but she could perform a long way from what the parent average is, because that’s nature. Parentage information, even genomic information, reduces risk – but I still put a lot of emphasis on the first herd test.

As a breeder, Brad uses his herd test information late-June and September to identify young cows for embryo transfer work. “If the genomics says they’re good and the early herd test information says they’re good, I’m happy. The herd test serves as good confirmation of decisions we make.”

Because the farm also does all-AB, it consistently has surplus heifer calves, and herd test information provides Brad with information on, for example, month-old calves: “So when I’m in a position to sell some, I’m always selling off my bottom-end,” he says.

The January herd test samples double as a test for Johne’s disease information, data that feeds in to the farm’s 10-year Johne’s control plan.

As a commercial farmer, Brad says herd testing is crucial in monitoring somatic cell counts, helps dictate mating decisions, helps decide on culls as possible feed pinches emerge, and heavily influences which surplus cows to sell (should there be a high number of replacement stock).

But the herd test is also a way of knowing which cows are delivering ‘honest’ milk:

“The milk docket gives you your herd average, but the herd test tells you who your really good cows are, and who aren’t.”

At the end of the season, herd test information is used for dry-off decisions, with days-in-milk and production worth balanced against the health and wellbeing status of the cow, and individuals picked out for targeted dry cow treatment.

Four Herd Tests Provide Information On

1st Test
- Monitor heifer performance
- Identity and manage high SCC cows at the start of lactation
- Fine tune breeding decisions
- Capture the first 60 days in milk
- BVD - PH Hunt
- Staph. aureus testing

2nd Test
- Identify pre-Christmas culls
- Monitor SCC per cow
- Staph. aureus testing
- Monitor mid-lactation production

3rd Test
- Monitor SCC per cow
- Use for drying off cows
- Use for targeting dry cow treatments
- Complete the picture with end of lactation information
- Identify end of season production culls
- Late season Milk Pregnancy test - identify empties before winter
- Staph. aureus testing

4th Test
- Consider early dry-offs and redirect feed to top producers
- Identify end of season culls
- Monitor SCC per cow
- Use for targeting dry cow treatments
- Milk Pregnancy testing
CAN LOW-METHANE BULLS BE BREDED?

by Lorna McNaughton, LIC reproduction scientist

The New Zealand Government has a stated commitment to reducing gross methane emissions by 10% (relative to 2017-levels) by 2030, and by 24-47% by 2050. This signals significant change for the agriculture industry, and more specifically, the dairy sector— which, according to the Ministry for the Environment, account for 48% and 22.9% respectively of all greenhouse gas emissions in New Zealand (mostly in the form of methane, although a small portion is in the form of nitrous oxide).

Ruminant livestock emit methane, mostly through burps, as part of the digestion process and the amount produced depends on how much feed is eaten and what type. It’s estimated dairy bulls burp every 90-120 seconds, so reducing this ‘gassy’ emission is a focus for many New Zealand breeding companies, including LIC.

Breeding is one tool that could be used to help dairy farmers reduce emissions on their farms.

Methane emissions have been shown to be heritable (0.10 to 0.20), a necessary step on the pathway to develop a breeding value. The degree of heritability is similar to that of somatic cell score (0.15), but lower than milk traits (0.31 to 0.36).

A joint project between LIC and CRV, funded by the New Zealand Agricultural Greenhouse Gas Research Centre (NZAGRC), aims to measure methane from dairy bulls entering the sire proving schemes of both breeding companies.

A significant trial is now taking place, part of it at LIC’s Chudleigh Farm at Tauwhare, east of Hamilton.

The project’s first stage was to design and develop methods that enabled the emissions of 300 to 350 bulls to be measured each year. To do this, a single pen was set up with a Greenfeed machine to measure methane, and feed bins allowed each bull’s intake to be measured.

Selection of feed type was important. The low dry matter of pasture, or pasture-silage, together with variations in quality meant that alternative feeds needed to be identified.

Lucerne hay cubes were selected because they were a forage high in dry matter. This also meant bulls only needed their feed bins topped up once or twice per day, with quality relatively consistent from year-to-year.

A small quantity of pelleted feed was available in the Greenfeed machine to entice the bulls to visit the machine.

When bulls initially put their head in the machine, pellets ‘dropped’, and kept dropping at specified intervals, to keep the bull’s head in the machine for at least two minutes.

Air was then sucked into the Greenfeed machine to ensure all of the bull’s breath was captured, with sub-samples analysed for methane.

The bulls were allowed to visit the Greenfeed up to five times a day. The diagram at the bottom of p30 shows the key parts of the Greenfeed machine.

Two pilot trials took place at both LIC’s Chudleigh Farm and at a CRV property.

After minor adjustments of methods and practice in using the machines, both LIC and CRV are confident that the planned trial design will work.

A full trial is now being planned, and will kick off in February 2021 at LIC and June 2021 at CRV.

Preliminary breeding values are expected after one year, although three years of data will be needed to estimate breeding values with a suitable degree confidence.

Genetic improvement is a slow game, but the process has begun, and the rewards are potentially significant for both farmers and New Zealand in general.
A SEASON OF CHANGE

In a wider context, of the last 66 years, there were 22 years that were beyond (i.e. more extreme) one-standard-deviation of the normal weather pattern. Remember, of those 22 instances, seven were in the last 10 years. During the past decade, five years have had much drier conditions than normal, and two years have experienced much wetter conditions than normal.

The above serves to only reinforce the notion (for Ruakura Research Farm, at least) that weather patterns are changing from traditional, longer term norms; we’re getting greater variability and extremes of rainfall, and the trend is toward much more drought-prone seasons.

With these changes in weather patterns we’re seeing some farmers trialing different farming practices and plant species to combat the emerging weather extremes. Plant agronomists are also trialing and proof-testing various pastures species for drought resistance.

This year, I’m trialing deeper-rooted plants on some of my Northland dairy farm paddocks; a more drought resistant Red Clover (Morrow), some additional tap-rooted crops including Chicory and a newer one called Pallaton Raphino, to complement my usual turnip crop (NB: these are merely a selection I’m trialing to see what may work best; I’m not endorsing any of these). I’ll let you know after summer how it went.

In August I attended a New Zealand Institute of Primary Industry Management (NZIPIM) one-day conference, where one slide in particular caught my attention:

The last 10 years of rainfall data shows that, for the period November to April, New Zealand has had seven instances (years) that were outside one-standard-deviation of the mean – this took into account the past 60-plus years of data.

In August I attended a New Zealand Institute of Primary Industry Management (NZIPIM) one-day conference, where one slide in particular caught my attention:

The last 10 years of rainfall data shows that, for the period November to April, New Zealand has had seven instances (years) that were outside one-standard-deviation of the mean – this took into account the past 60-plus years of data.

**POST AB: WHAT NOW?**

As we come out of the AB mating period it is important that you:

- Rotate and keep track of your bull health to ensure they tail the late-cyclers well.
- Monitor your post-peak milk production decline; take advice or action if sudden drops are being experienced. The maintenance of good-quality feed intake will help elongate and slow the daily production decline.
- Continue to review your pasture quality and ensure seed head emergence is kept under control. Where appropriate, ensure paddocks are skipped and turned into silage so lactating cows are fed the best grass on farm every day.
- Review your combined feed demand for the rest of the season. Coming out of winter and spring, do you have:
  - (i) expected pasture levels;
  - (ii) crops in the ground, and;
  - (iii) supplements, including those stockpiled and contracted.

Be realistic – do you have enough to cover a tough summer? What actions, including dry-off, may you need to take, and what are the trigger points? Understand your system and know when you should act to optimise your resources. For self-help on setting up a summer plan, use, for example, DairyNZ’s summer management plan (https://www.dairynz.co.nz/media/578718/summer-management-plan-dairynz.pdf)

- Take time to review how calving went. Seriously consider what factors/decisions/tasks worked well, and what would you do differently next year.
- Assess your mating performance. Check out your InCalf Fertility Focus Report in MINDA for good clues on performance and potential issues. Compare your performance to industry norms, including the six week in-calf rate and herd reproductive performance.
- Use herd test data and the body condition score (BCS) of your animals to check they are at optimum condition and performance for efficient milk production. Weigh your young stock monthly or bi-monthly, and enter the data into MINDA to check how the animals are progressing against desirable growth rates. Beware of animal heat stress and what mitigations you’re able to use.
- Consider when you might change your milking frequency. There is some good information on this that’s freely available, including on the LIC website https://www.lic.co.nz/news/how-few-can-we-do-evolution-flexible-milking-frequency/
- Finally, post-mating is the time to start thinking about next season staff arrangements. Will the current agreements and people be part of the team next year? Any gaps, replacements, or changes required? Discuss, identify, and confirm early so recruitment plans can be started prior to Christmas.

Review, plan, and monitor: This will provide a good basis to respond and adjust the farming system to the ever-changing environment.

When you need support, ask a qualified rural professional; they are there to help make your business successful. Good robust plans and scenario analyses will always set you up better than just going along as “per normal” (remember, 7 out of the last 10 years haven’t been normal!).

To get in-touch with Edward or any of his team of FarmWise consultants, to either help review your operations or support your business, go to https://www.lic.co.nz/products-and-services/farmwise-consultancy/
There’s always room for improvement

Selecting bulls for your future progeny has always been about herd efficiency, sustainability and improvement. Now we’re making the sustainability part a little easier.

LIC’s new HoofPrint index assigns bulls a score based on their progeny’s estimated methane and nitrogen efficiency. The higher the score, the more improvement on your farm and the environment. And that could give NZ, a greener footprint.

Talk to your Agri Manager about the HoofPrint index today.
